## 1.1 Objectives

Health check download for bigguery unravel product.

#### 1.2 Architecture

## **Health Check Process**

## 1.3 Prerequisite

#### A. BigQuery Permissions/roles required to download metadata:

- a. Permissions required to download the JOBS, JOBS\_TIMELINE metadata:
  - i. bigquery.jobs.create
  - ii. bigquery.jobs.listAll
  - iii. storage.objects.create
  - iv. storage.objects.list
- b. Permissions required to download Billing Data:
  - i. bigquery.jobs.create
  - ii. bigguery.tables.getData
  - iii. storage.objects.create
  - iv. storage.objects.list

## 1.4 Download BigQuery Metadata for health check.

#### Do the following to download BigQuery metadata:

- Clone this repo: https://github.com/unraveldata-org/BigQuery-data-loader.git
- Follow below Steps to create a Service Account key that has above roles which will authenticate to download the JOBS, JOBS\_TIMELINE and Billing metadata:
  - a. cd terraform/healthcheck
  - b. cp input.tfvars.example input.tfvars
  - c. open input.tfvars
  - d. Under monitoring\_project\_ids add the project ids for which you want to download JOBS and JOBS\_TIMELINE Data (perform health check)
  - Under billing\_project\_ids add the project in which you have billing data exported
  - f. Under svc\_account\_project\_id add the project on which you want the service account to be created to execute the download script
  - g. Now, open local.tf
  - h. Under monitoring\_project\_role\_permission add the below permissions, comma separated (ignore if the same permissions are already present):
    - i. "bigquery.jobs.create"
    - ii. "bigquery.jobs.listAll"
    - iii. "storage.objects.create"
    - iv. "storage.objects.list"
  - Under billing\_project\_role\_permission add the below permissions, comma separated (ignore if the same permissions are already present):

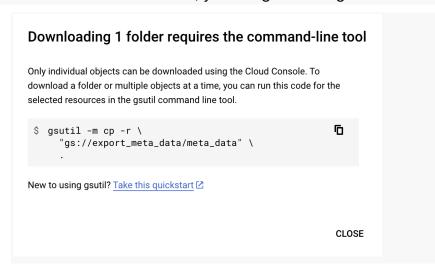

- i. "bigquery.jobs.create"
- ii. "bigquery.tables.getData"
- iii. "storage.objects.create"
- iv. "storage.objects.list"
- j. Before using this project, you need to authenticate with Google Cloud using gcloud. Follow the instructions provided at <a href="https://cloud.google.com/sdk/docs/install-sdk">https://cloud.google.com/sdk/docs/install-sdk</a> for a one-time configuration. You can find the installation instruction based on the Machine Arch and OS installed in the above link.
- k. To authenticate gcloud, execute the following commands:
  - i. gcloud init
  - ii. gcloud auth application-default login
- I. Download and install terraform (<u>Documentation</u>)
- m. Now, to run terraform execute the following:
  - i. terraform init
  - ii. terraform plan --var-file=input.tfvars
  - iii. terraform apply --var-file=input.tfvars
- Now, there must be a credential file created inside terraform/healthcheck/keys folder, you will need this credential file while providing configuration for the download script
- 3. cd Data Downloader Script
- 4. cp download\_config.yaml.example download\_config.yaml
- Open download\_config.yaml file and edit it with your configuration :
  - a. gcs bucket path: "add the gcs bucket path where you want to download the csv files" (To know how to create a gcs bucket check the <u>Steps for creating a gcs bucket</u>)
  - b. <u>locations</u>: "add comma separated regions where you execute your queries on the projects"
  - c. <a href="mailto:projects">projects</a>: "replace this with comma separated project\_ids for which you want to download JOBS data / perform health check"
  - d. <u>billing\_project</u>: "replace this with the project\_id where billing data is exported"
  - e. <u>billing\_dataset</u>: "replace this with the dataset\_id where billing data is exported"
  - f. <u>billing table</u>: "replace this with the table\_name where billing data is exported"
  - g. <u>credential</u>: "replace this with path of the credential file created in previous step through terraform"
- 6. Install required python packages using: pip3 install -r requirements.txt
- 7. Run download script with below command:

python3 /path/to/download\_metadata.py --config\_file /path/to/download\_config.yaml

- 8. CSV files containing the JOBS, JOBS\_TIMELINE and BILLING metadata will be downloaded to the gcs bucket defined in download\_config.yaml file
- 9. Now, download these files to your local by using google-sdk by following given steps:
  - Go to the gcs bucket where metadata is downloaded
  - b. Tick the folder where all the downloaded csv files are present
  - c. Click on download button, you will get a dialog box like this:

- copy the command and run it on gcloud cli installed previously, you will get all the files downloaded to the current directory on your local
- 10. To destroy the roles and key created by terraform, run:
  - a. cd ../terraform/healthcheck/
  - b. terraform destroy --var-file=input.tfvars
- 11. Share these files through Google Drive to the the Unravel POC

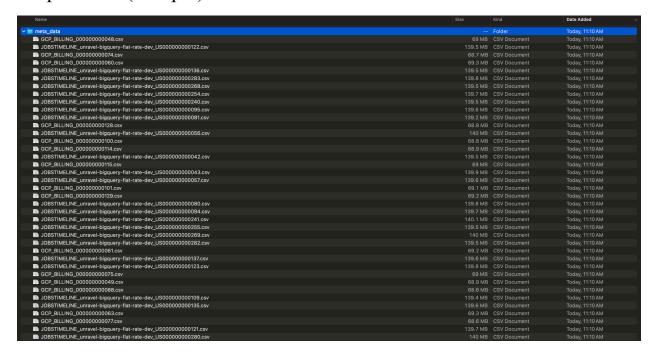

## Steps for creating a gcs bucket:

- Go to the Cloud Storage Buckets page: <a href="https://console.cloud.google.com/storage/browser">https://console.cloud.google.com/storage/browser</a> in the Google Cloud console.
- 2. Click + Create.
- 3. On the Create a bucket page, enter the following information:
  - a. Name your bucket: Enter a unique name for your bucket. The name must start with a lowercase letter or number, and it can contain up to 63 characters. It can also contain dashes and periods.

- b. Choose where to store your data: Select a location for your bucket. You can choose a location in the same region as your project, or you can choose a different region.
- c. Choose a storage class for your data: Select a storage class for your bucket. The storage class determines how long your data is kept and how much it costs to store.
- 4. Click Create.
- 5. Create new folder in bucket

## 1.5 Output Files (Sample)
